On the C -flat dimension of injective modules<https://doi.org/10.1515/gmj-2025-2021>

Received September 9, 2024; revised January 9, 2025; accepted January 15, 2025

Abstract: Let R and S be rings and let ${}_R C_S$ be a semidualizing bimodule. We investigate the behavior of the C -flat dimension of injective left R -modules, and establish the relation among the supremum of these C -flat dimensions and the supremum of C -injective dimensions of projective left S -modules and the supremum of C -projective dimensions of injective left R -modules.

Keywords: Semidualizing modules, C -projective dimension, C -injective dimension, C -flat dimension, relative homological invariants

MSC 2020: 16E10, 18G20, 18G25

1 Introduction

Semidualizing bimodules arise naturally in the investigation of various duality theories in commutative ring theory. The study of such modules was initiated by Foxby [9] and Golod [10]. Then Holm and White [11] extended it to arbitrary associative rings. Many authors have studied the properties of semidualizing modules and related modules (see, e.g., [3, 5, 9–13, 16–24] and the references therein). Among various research areas on semidualizing modules, one basic theme is to extend the “absolute” classical results in homological algebra to the “relative” setting with respect to semidualizing modules. The motivation of this paper comes from Emmanouil and Talelli’s work [8], in which the relations among the supremum of the projective dimensions of injective left R -modules, the injective dimensions of projective left R -modules, the finitistic dimension and the left self-injective dimension of a ring R were established. Our aim is to give the relative counterparts with respect to semidualizing modules of these results.

The paper is organized as follows. In Section 2, we give some terminology and some preliminary results.

Let R and S be arbitrary rings and let ${}_R C_S$ be a semidualizing bimodule. In Section 3, we first investigate the relationship between the supremum $\text{spcli } R$ of the C -projective dimensions of injective left R -modules and the supremum $\text{sfcli } R$ of the C -flat dimensions of injective left R -modules. We give some upper bounds of $\text{spcli } R$ in terms of $\text{sfcli } R$ together with other relative homological invariants (Proposition 3.2). Moreover, we prove the following result.

Theorem 1.1 (Theorem 3.5). *For any left R -module M and $n \geq 1$, if the C -projective dimension of M is at most n and $\text{Ext}_R^n(M, C) = 0$, then the C -flat dimension of M is at most $n - 1$.*

As a consequence, we get that for any $n \geq 1$, if $\text{spcli } R \leq n$ and the injective dimension of ${}_R C$ is at most $n - 1$, then $\text{sfcli } R \leq n - 1$ (Corollary 3.8).

The finitistic C -flat dimension $\mathcal{F}_C(R)$ -FPD is defined as the supremum of the C -flat dimensions of left R -modules with finite C -flat dimension. We establish the relation among $\text{spcli } R$, $\text{spcli } S^{\text{op}}$ and $\mathcal{F}_C(R)$ -FPD as follows: it holds that $\mathcal{F}_C(R)$ -FPD $\leq \text{sfcli } S^{\text{op}}$ and that $\text{sfcli } R \leq \mathcal{F}_C(R)$ -FPD if $\text{sfcli } R < \infty$ (Proposition 3.10).

In Section 4, we establish the relation among $\text{spcli } R$, $\text{spcli } S^{\text{op}}$, $\text{sfcli } R$, $\text{sfcli } S^{\text{op}}$ and other related relative homological invariants over \aleph_0 -Noetherian rings.

Theorem 1.2 (Theorem 4.3). *If R is a right \aleph_0 -Noetherian ring and S is a left \aleph_0 -Noetherian ring, then $\text{spcli } R < \infty$ and $\text{spcli } S^{\text{op}} < \infty$ if and only if $\text{sfcli } R < \infty$ and $\text{sfcli } S^{\text{op}} < \infty$. In this case, we have*

$$|\text{spcli } R - \text{spcli } S^{\text{op}}| \leq 1.$$

For a left R -module M , we use $\text{id}_R M$ to denote the injective dimension of M . The invariant $\text{siclp } S$ is defined as the supremum of the C -injective dimensions of projective left S -modules.

Theorem 1.3 (Theorems 4.6 and 4.9). *The following statements hold:*

(1) *If R is a left \aleph_0 -Noetherian ring, then*

$$\text{sfcli } S^{\text{op}} \leq \text{id}_R C^{(\mathbb{N})} = \text{siclp } S,$$

where \mathbb{N} is the set of natural numbers.

(2) *If R is a left Noetherian ring, then*

$$\text{sfcli } S^{\text{op}} = \text{id}_R C = \text{siclp } S \geq \max\{\text{Fflic } S, \text{Fplic } S\},$$

where $\text{Fflic } S$ (resp. $\text{Fplic } S$) is the supremum of the flat (resp. projective) dimensions of C -injective left S -modules with finite flat (resp. projective) dimension.

By using Theorem 1.3 (1), we prove that for any left \aleph_0 -Noetherian ring R and $n \geq 1$, if $\text{id}_R C \leq n$ and $\text{sfcli } S^{\text{op}} \leq n - 1$, then $\text{siclp } S \leq n$; furthermore, if $\text{id}_R C < \text{siclp } S$, then $\text{siclp } S = \text{sfcli } S^{\text{op}} + 1$ (Proposition 4.7).

2 Preliminaries

Throughout this paper, all rings are associative rings with unit. Let R be a ring. We use $\text{Mod } R$ (resp. $\text{Mod } R^{\text{op}}$) to denote the class of left (resp. right) R -modules. We use $\mathcal{F}(R)$, $\mathcal{P}(R)$ and $\mathcal{I}(R)$ to denote the subclasses of $\text{Mod } R$ consisting of flat, projective and injective modules, respectively. For a module $M \in \text{Mod } R$, we use $\text{fd}_R M$, $\text{pd}_R M$ and $\text{id}_R M$ to denote the flat, projective and injective dimensions of M , respectively.

Let \mathcal{X} be a subclass of $\text{Mod } R$ and $M \in \text{Mod } R$. The \mathcal{X} -projective dimension $\mathcal{X}\text{-pd } M$ of M is defined as $\inf\{n \mid \text{there exists an exact sequence}$

$$0 \rightarrow X_n \rightarrow \cdots \rightarrow X_1 \rightarrow X_0 \rightarrow M \rightarrow 0$$

$\text{in } \text{Mod } R \text{ with all } X_i \text{ in } \mathcal{X}\}$, and set $\mathcal{X}\text{-pd } M = \infty$ if no such integer exists, and set $\mathcal{X}\text{-pd } 0 = -1$. Dually, the notion of the \mathcal{X} -injective dimension $\mathcal{X}\text{-id } M$ of M is defined. We write

$$\mathcal{X}\text{-FPD} := \sup\{\mathcal{X}\text{-pd } M \mid M \in \text{Mod } R \text{ with } \mathcal{X}\text{-pd } M < \infty\},$$

$$\mathcal{X}\text{-FID} := \sup\{\mathcal{X}\text{-id } M \mid M \in \text{Mod } R \text{ with } \mathcal{X}\text{-id } M < \infty\}.$$

Definition 2.1 ([3, 11]). Let R and S be rings. An (R, S) -bimodule ${}_R C_S$ is called *semidualizing* if the following conditions are satisfied:

- (a1) ${}_R C$ admits a degreewise finite R -projective resolution.
- (a2) C_S admits a degreewise finite S^{op} -projective resolution.
- (b1) The homothety map ${}_R R_R \xrightarrow{{}_R \gamma} \text{Hom}_{S^{\text{op}}}(C, C)$ is an isomorphism.
- (b2) The homothety map ${}_S S_S \xrightarrow{\gamma_S} \text{Hom}_R(C, C)$ is an isomorphism.
- (c1) $\text{Ext}_R^{\geq 1}(C, C) = 0$.
- (c2) $\text{Ext}_{S^{\text{op}}}^{\geq 1}(C, C) = 0$.

Wakamatsu [22] introduced and studied the so-called *generalized tilting modules*, which are usually called *Wakamatsu tilting modules* (see [5, 17]). Note that a bimodule ${}_R C_S$ is semidualizing if and only if it is Wakamatsu tilting

(see [24, Corollary 3.2]). Typical examples of semidualizing bimodules include the free module of rank one and the dualizing module over a Cohen–Macaulay local ring. For more examples of semidualizing bimodules, the reader is referred to [11, 20, 23].

From now on, R and S are arbitrary rings and we fix a semidualizing bimodule ${}_R C_S$. For convenience, we write

$$(-)_* := \text{Hom}(C, -).$$

A sequence in $\text{Mod } R$ is called $\text{Hom}_R(C, -)$ -exact if it is exact after applying the functor $(-)_*$. Following [11], set

$$\mathcal{F}_C(R) := \{C \otimes_S F \mid F \text{ is flat in } \text{Mod } S\},$$

$$\mathcal{P}_C(R) := \{C \otimes_S P \mid P \text{ is projective in } \text{Mod } S\},$$

$$\mathcal{I}_C(S) := \{I_* \mid I \text{ is injective in } \text{Mod } R\}.$$

The modules in $\mathcal{F}_C(R)$, $\mathcal{P}_C(R)$ and $\mathcal{I}_C(S)$ are called C -flat, C -projective and C -injective, respectively. When ${}_R C_S = {}_R R_R$, C -flat, C -projective and C -injective modules are exactly flat, projective and injective modules, respectively. Symmetrically, the classes of $\mathcal{F}_C(S^{\text{op}})$, $\mathcal{P}_C(S^{\text{op}})$ and $\mathcal{I}_C(R^{\text{op}})$ are defined.

We define

$$\text{spclfc } R := \sup\{\mathcal{P}_C(R)\text{-pd } M \mid M \in \mathcal{F}_C(R)\},$$

$$\text{siclf } S := \sup\{\mathcal{I}_C(S)\text{-id } N \mid N \in \mathcal{F}(S)\},$$

$$\text{siclp } S := \sup\{\mathcal{I}_C(S)\text{-id } N \mid N \in \mathcal{P}(S)\},$$

$$\text{sfcli } R := \sup\{\mathcal{F}_C(R)\text{-pd } M \mid M \in \mathcal{I}(R)\},$$

$$\text{spcli } R := \sup\{\mathcal{P}_C(R)\text{-pd } M \mid M \in \mathcal{I}(R)\},$$

$$\text{silfc } R := \sup\{\text{id}_R M \mid M \in \mathcal{F}_C(R)\},$$

$$\text{silpc } R := \sup\{\text{id}_R M \mid M \in \mathcal{P}_C(R)\},$$

$$\text{sflic } S := \sup\{\text{fd}_S N \mid N \in \mathcal{I}_C(S)\},$$

$$\text{splic } S := \sup\{\text{pd}_S N \mid N \in \mathcal{I}_C(S)\}.$$

It is trivial that $\text{siclp } S \leq \text{siclf } S$ and $\text{sfcli } R \leq \text{spcli } R$. In addition, by [21, Lemma 2.6], we have

$$\text{siclf } S = \text{silfc } R, \quad \text{siclp } S = \text{silpc } R, \quad \text{sfcli } R = \text{sflic } S, \quad \text{spcli } R = \text{splic } S.$$

Let $N \in \text{Mod } S$ and $M \in \text{Mod } R$. Then there exist the following two canonical evaluation homomorphisms:

$$\mu_N : N \rightarrow (C \otimes_S N)_*$$

defined by $\mu_N(x)(c) = c \otimes x$ for any $c \in C$ and $x \in N$, and

$$\theta_M : C \otimes_S M_* \rightarrow M$$

defined by $\theta_M(c \otimes f) = f(c)$ for any $c \in C$ and $f \in M_*$.

Definition 2.2 ([11]). (1) The Auslander class $\mathcal{A}_C(S)$ with respect to C consists of all left S -modules N satisfying the following conditions:

$$(A1) \quad \text{Tor}_{\geq 1}^S(C, N) = 0.$$

$$(A2) \quad \text{Ext}_R^{\geq 1}(C, C \otimes_S N) = 0.$$

$$(A3) \quad \mu_N \text{ is an isomorphism.}$$

(2) The Bass class $\mathcal{B}_C(R)$ with respect to C consists of all left R -modules M satisfying the following conditions:

$$(B1) \quad \text{Ext}_R^{\geq 1}(C, M) = 0.$$

$$(B2) \quad \text{Tor}_{\geq 1}^S(C, M_*) = 0.$$

$$(B3) \quad \theta_M \text{ is an isomorphism.}$$

The Auslander class $\mathcal{A}_C(R^{\text{op}})$ in $\text{Mod } R^{\text{op}}$ and the Bass class $\mathcal{B}_C(S^{\text{op}})$ in $\text{Mod } S^{\text{op}}$ are defined symmetrically.

3 sfcli R and related invariants

3.1 The relation between sfcli R and spcli R

We begin with the following observation.

Lemma 3.1 ([21, Theorem 3.3]). *We have $\text{spclfc } R \leq \mathcal{P}_C(R)\text{-FPD} \leq \text{siclp } S = \text{siclf } S$.*

Proof. We only give the proof of the equality $\mathcal{P}_C(R)\text{-FPD} \leq \text{siclp } S$, which is different from that in [21].

Let $M \in \text{Mod } R$ with $\mathcal{P}_C(R)\text{-pd } M = n < \infty$ and

$$0 \rightarrow C \otimes_S P_n \rightarrow \cdots \rightarrow C \otimes_S P_1 \rightarrow C \otimes_S P_0 \rightarrow M \rightarrow 0$$

be an exact sequence in $\text{Mod } R$ with all P_i projective in $\text{Mod } S$. According to [21, Lemma 2.5 (1)], applying the functor $(-)_*$ to the above exact sequence yields the following exact sequence:

$$0 \rightarrow (C \otimes_S P_n)_* \rightarrow \cdots \rightarrow (C \otimes_S P_1)_* \rightarrow (C \otimes_S P_0)_* \rightarrow M_* \rightarrow 0$$

in $\text{Mod } S$. By [11, Lemma 4.1], we have $(C \otimes_S P_i)_* \cong P_i$ for any $0 \leq i \leq n$. Since $M \in \mathcal{B}_C(R)$ by [11, Corollary 6.1], it follows from [21, Lemma 2.6 (1)] that $\text{pd}_S M_* = \mathcal{P}_C(R)\text{-pd } M = n$, and hence $\text{Ext}_S^n(M_*, (C \otimes_S P_n)_*) \neq 0$. Then, by [11, Theorem 6.4 (b)], we have

$$\text{Ext}_R^n(M, C \otimes_S P_n) \cong \text{Ext}_S^n(M_*, (C \otimes_S P_n)_*) \neq 0,$$

which implies $\text{id}_R C \otimes_S P_n \geq n$, and hence $\mathcal{I}_C(S)\text{-id } P_n \geq n$ by [11, Lemma 4.1] and [21, Lemma 2.6 (3)]. The assertion follows. \square

The second inequality in the following result was obtained in [21, Theorem 4.3 (2)] when the semidualizing bimodule ${}_R C_S$ is faithful.

Proposition 3.2. *It holds that*

$$\text{sfcli } R \leq \text{spcli } R \leq \text{sfcli } R + \text{spclfc } R \leq \text{sfcli } R + \mathcal{P}_C(R)\text{-FPD} \leq \text{sfcli } R + \text{siclp } S.$$

Proof. By Lemma 3.1, it suffices to prove the second inequality.

Suppose $\text{sfcli } R = n < \infty$ and $\text{spclfc } R = m < \infty$, and let $I \in \text{Mod } R$ be injective. It follows from [11, Lemma 4.1 and Theorem 6.1] that $I \in \mathcal{B}_C(R)$ and there exists a $\text{Hom}_R(C, -)$ -exact sequence

$$\cdots \longrightarrow C \otimes_S P_n \longrightarrow C \otimes_S P_{n-1} \xrightarrow{d_{n-1}} \cdots \longrightarrow C \otimes_S P_0 \longrightarrow I \longrightarrow 0$$

in $\text{Mod } R$ with all P_i projective in $\text{Mod } S$. Applying the functor $(-)_*$ to the above exact sequence yields the following exact sequence:

$$\cdots \longrightarrow (C \otimes_S P_n)_* \longrightarrow (C \otimes_S P_{n-1})_* \xrightarrow{(d_{n-1})_*} \cdots \longrightarrow (C \otimes_S P_0)_* \longrightarrow I_* \longrightarrow 0.$$

By [11, Lemma 4.1], we have $(C \otimes_S P_i)_* \cong P_i$ for any $i \geq 0$. So, the above exact sequence is a projective resolution of I_* in $\text{Mod } S$. By [21, Lemma 2.6 (1)], we have

$$\text{fd}_S I_* = \mathcal{F}_C(R)\text{-pd } I \leq \text{sfcli } R = n,$$

and hence $K_n := \text{Ker}(d_{n-1})_*$ is flat, which is in $K_n \in \mathcal{A}_C(S)$ by [11, Lemma 4.1] again. Then, by [11, Theorem 1] and [21, Lemma 2.6 (1)], we have $C \otimes_S K_n \in \mathcal{B}_C(R)$ and

$$\text{pd}_S K_n = \text{pd}_S (C \otimes_S K_n)_* = \mathcal{P}_C(R)\text{-pd}(C \otimes_S K_n) \leq \text{spclfc } R = m,$$

and hence $\text{pd}_S I_* \leq n + m$. Then, by [21, Lemma 2.6 (1)], we have

$$\mathcal{P}_C(R)\text{-pd } I = \text{pd}_S I_* \leq n + m,$$

and $\text{spcli } R \leq n + m$. \square

The following result was proved in [21, Corollary 4.4] when the semidualizing bimodule ${}_R C_S$ is faithful.

Corollary 3.3. *The following statements are equivalent:*

- (1) $\text{spcli } R = \text{siclp } S < \infty$.
- (2) $\text{spcli } R < \infty$ and $\text{siclp } S < \infty$.
- (3) $\text{sfcli } R < \infty$ and $\text{siclp } S < \infty$.

Proof. If $\text{siclp } S < \infty$, then $\text{spclfc } R < \infty$ by Lemma 3.1. It follows from Proposition 3.2 that $\text{spcli } R < \infty$ if and only if $\text{sfcli } R < \infty$, and the assertion (2) \Leftrightarrow (3) follows.

The implication (1) \Rightarrow (2) is trivial.

(2) \Rightarrow (1) Let $\text{spcli } R = n < \infty$ and let $I \in \text{Mod } R$ be injective with $\mathcal{P}_C(R)\text{-pd } I = n$. Then there exists an exact sequence

$$0 \longrightarrow C \otimes_S P_n \longrightarrow C \otimes_S P_{n-1} \xrightarrow{d_{n-1}} \cdots \longrightarrow C \otimes_S P_0 \longrightarrow I \longrightarrow 0$$

in $\text{Mod } R$ with all P_i projective in $\text{Mod } S$. By [21, Lemma 2.5 (1)], we have $\text{Ext}_R^{\geq 1}(C \otimes_S P_i, C \otimes_S P_n) = 0$ for any $0 \leq i \leq n$, and so

$$\text{Ext}_R^n(I, C \otimes_S P_n) \cong \text{Ext}_R^1(\mathbb{J}d_{n-1}, C \otimes_S P_n) \neq 0.$$

Since $P_n \in \mathcal{A}_C(S)$ by [11, Lemma 4.1], we have

$$\text{siclp } S \geq \mathcal{J}_C(S)\text{-id } P_n = \text{id}_R C \otimes_S P_n \geq n = \text{spcli } R$$

by [21, Lemma 2.6 (3)].

Conversely, let $\text{siclp } S = m < \infty$ and let $P \in \text{Mod } S$ be projective with $\mathcal{J}_C(S)\text{-pd } P = m$. Then there exists an exact sequence

$$0 \longrightarrow P \longrightarrow I^0_* \longrightarrow \cdots \xrightarrow{d^{m-1}} I^{m-1}_* \longrightarrow I^m_* \longrightarrow 0$$

in $\text{Mod } S$ with all I^i injective in $\text{Mod } R$. By [21, Lemma 2.5 (2)], we have $\text{Ext}_R^{\geq 1}(I^m_*, I^i_*) = 0$ for any $0 \leq i \leq m$, and so

$$\text{Ext}_R^m(I^m_*, P) \cong \text{Ext}_R^1(I^m_*, \mathbb{J}d^{m-1}_*) \neq 0.$$

Since $I^m \in \mathcal{B}_C(R)$ by [11, Lemma 4.1], we have

$$\text{spcli } R \geq \mathcal{P}_C(R)\text{-pd } I^m = \text{pd}_S I^m_* \geq m = \text{siclp } S$$

by [21, Lemma 2.6 (1)]. The proof is finished. \square

As a consequence, we obtain the following corollary.

Corollary 3.4. *If $\text{spcli } R < \infty$ and $\text{siclp } S < \infty$, then*

$$\text{spcli } R = \mathcal{P}_C(R)\text{-FPD} = \text{siclp } S.$$

Proof. By assumption and Lemma 3.1, we have

$$\text{spcli } R \leq \mathcal{P}_C(R)\text{-FPD} \leq \text{siclp } S.$$

Now the assertion follows from Corollary 3.3. \square

We will examine the extent to which the inequality $\mathcal{F}_C(R)\text{-pd } M \leq \mathcal{P}_C(R)\text{-pd } M$ is strict.

Theorem 3.5. *Let $M \in \text{Mod } R$ and $n \geq 1$. If $\mathcal{P}_C(R)\text{-pd } M \leq n$ and $\text{Ext}_R^n(M, C) = 0$, then $\mathcal{F}_C(R)\text{-pd } M \leq n - 1$.*

Proof. Suppose $\mathcal{P}_C(R)\text{-pd } M \leq n$. Then $M \in \mathcal{B}_C(R)$ by [11, Corollary 6.1]. It follows from [21, Lemma 2.6 (1)–(2)] that

$$\mathcal{P}_C(R)\text{-pd } M \leq n \iff \text{pd}_S M_* \leq n, \quad (3.1)$$

$$\mathcal{F}_C(R)\text{-pd } M \leq n - 1 \iff \text{fd}_S M_* \leq n - 1. \quad (3.2)$$

By [11, Theorem 6.4 (b)], we have

$$\text{Ext}_R^n(M, C) \cong \text{Ext}_S^n(M_*, C_*) \cong \text{Ext}_S^n(M_*, S). \quad (3.3)$$

It follows that

$$\begin{aligned} \mathcal{P}_C(R)\text{-pd } M \leq n \text{ and } \text{Ext}_R^n(M, C) = 0 &\iff \text{pd}_S M_* \leq n \text{ and } \text{Ext}_S^n(M_*, S) = 0 \quad (\text{by (3.1) and (3.3)}) \\ &\implies \text{fd}_S M_* \leq n - 1 \quad (\text{by [8, Theorem 2.11]}) \\ &\iff \mathcal{F}_C(R)\text{-pd } M \leq n - 1 \quad (\text{by (3.2)}). \end{aligned} \quad \square$$

The following corollary is an immediate consequence of Theorem 3.5.

Corollary 3.6. *Let $M \in \text{Mod } R$ and $n \geq 1$. If $\mathcal{P}_C(R)\text{-pd } M \leq n$ and $\text{id}_R C \leq n - 1$, then $\mathcal{F}_C(R)\text{-pd } M \leq n - 1$. In particular, if $\mathcal{P}_C(R)\text{-pd } M \leq 1$ and ${}_R C$ is injective, then $M \in \mathcal{F}_C(R)$.*

Let R be an Artin algebra and let ${}_R C$ be the direct sum of all representatives of indecomposable injective left R -modules which appear in the minimal injective coresolution of ${}_R R$ as direct summands of some term. Then ${}_R C_S$ is a semidualizing bimodule with $S = \text{End}({}_R C)$. In this case, it is clear that ${}_R C$ is injective.

The rest of the results in this subsection are consequences of Corollary 3.6.

Corollary 3.7. *The following assertions hold:*

(1) *Let $M \in \text{Mod } R$. If $\mathcal{F}_C(R)\text{-pd } M = \mathcal{P}_C(R)\text{-pd } M < \infty$, then*

$$\mathcal{F}_C(R)\text{-pd } M = \mathcal{P}_C(R)\text{-pd } M \leq \text{id}_R C.$$

(2) *If S is a left perfect ring (in particular, if S is a left or right artinian ring), then*

$$\mathcal{F}_C(R)\text{-FPD} = \mathcal{P}_C(R)\text{-FPD} \leq \text{id}_R C.$$

Proof. (1) Let $\mathcal{F}_C(R)\text{-pd } M = \mathcal{P}_C(R)\text{-pd } M = n < \infty$. If $\text{id}_R C < n$, then $\mathcal{F}_C(R)\text{-pd } M \leq n - 1$ by Corollary 3.6, which is a contradiction.

(2) If S is a left perfect ring, then a left S -module is flat if and only if it is projective. So $\mathcal{F}_C(R) = \mathcal{P}_C(R)$, and hence $\mathcal{F}_C(R)\text{-pd } M = \mathcal{P}_C(R)\text{-pd } M$ for any $M \in \text{Mod } R$. Now the assertion follows from (1). \square

Corollary 3.8. *For any $n \geq 1$, if $\text{spcli } R \leq n$ and $\text{id}_R C \leq n - 1$, then $\text{sfcli } R \leq n - 1$.*

Proof. Let $I \in \text{Mod } R$ be injective. Then $\mathcal{P}_C(R)\text{-pd } I \leq \text{spcli } R \leq n$ by assumption. It follows from Corollary 3.6 that $\mathcal{F}_C(R)\text{-pd } I \leq n - 1$ and $\text{sfcli } R \leq n - 1$. \square

Corollary 3.9. *The following assertions hold:*

(1) *If $\text{sfcli } R = \text{spcli } R < \infty$, then $\text{sfcli } R = \text{spcli } R \leq \text{id}_R C$.*

(2) *If $\text{id}_R C < \text{spcli } R < \infty$, then $\text{sfcli } R < \text{spcli } R$.*

Proof. (1) Let $\text{sfcli } R = \text{spcli } R = n < \infty$. If $\text{id}_R C < n$, then $\text{sfcli } R \leq n - 1$ by Corollary 3.8, which is a contradiction.

(2) It follows from (1). \square

3.2 The relation between $\text{sfcli } R$ and $\mathcal{F}_C(R)\text{-FPD}$

Proposition 3.10. *The following assertions hold:*

(1) $\mathcal{F}_C(R)\text{-FPD} \leq \text{sfcli } S^{\text{op}}$.

(2) *If $\text{sfcli } R < \infty$, then $\text{sfcli } R \leq \mathcal{F}_C(R)\text{-FPD}$.*

Proof. (1) Let $M \in \text{Mod } R$ with $\mathcal{F}_C(R)\text{-pd } M = n < \infty$. By [11, Corollary 6.1] and [21, Lemma 2.6 (1)], we have $M \in \mathcal{B}_C(R)$ and $\text{fd}_S M_* = \mathcal{F}_C(R)\text{-pd } M = n$. Then there exists some module $A \in \text{Mod } S^{\text{op}}$ such that $\text{Tor}_n^S(A, M_*) \neq 0$. Let

$$0 \rightarrow A \rightarrow I \rightarrow I/A \rightarrow 0$$

be an exact sequence in $\text{Mod } S^{\text{op}}$ with I injective. It induces the following exact sequence:

$$0 = \text{Tor}_{n+1}^S(I/A, M_*) \rightarrow \text{Tor}_n^S(A, M_*) \rightarrow \text{Tor}_n^S(I, M_*),$$

which implies $\text{Tor}_n^S(I, M_*) \neq 0$.

Since $M \in \mathcal{B}_C(R)$, we have $M_* \in \mathcal{A}_C(S)$ by [11, Theorem 1]. Note that $I \in \mathcal{B}_C(S^{\text{op}})$ by [11, Lemma 4.1]. It follows from [11, Theorem 6.4 (c)] that

$$\text{Tor}_n^R(I_*, C \otimes_S M_*) \cong \text{Tor}_n^S(I, M_*) \neq 0$$

and $\text{fd}_{R^{\text{op}}} I_* \geq n$. Then, by [21, Lemma 2.6 (3)], we have $\mathcal{F}_C(S^{\text{op}})\text{-pd } I = \text{fd}_{R^{\text{op}}} I_* \geq n$. The assertion follows.

(2) If $\text{sfcli } R = n < \infty$, then there exists an injective left R -module I such that $\mathcal{F}_C(R)\text{-pd } I = n$, and hence

$$\mathcal{F}_C(R)\text{-FPD} \geq \mathcal{F}_C(R)\text{-pd } I = n = \text{sfcli } R. \quad \square$$

Corollary 3.11. *If $\text{sfcli } R < \infty$ and $\text{sfcli } S^{\text{op}} < \infty$, then*

$$\text{sfcli } R = \mathcal{F}_C(R)\text{-FPD} = \text{sfcli } S^{\text{op}} = \mathcal{F}_C(S^{\text{op}})\text{-FPD}.$$

Proof. By Proposition 3.10, we have

$$\text{sfcli } R \leq \mathcal{F}_C(R)\text{-FPD} \leq \text{sfcli } S^{\text{op}} \leq \mathcal{F}_C(S^{\text{op}})\text{-FPD} \leq \text{sfcli } R. \quad \square$$

Corollary 3.12. *If $R \cong S^{\text{op}}$ and $\text{sfcli } R < \infty$, then $\text{sfcli } R = \mathcal{F}_C(R)\text{-FPD}$.*

4 \aleph_0 -Noetherian rings

Lemma 4.1. *It holds that:*

- (1) $\mathcal{F}_C(R)\text{-FPD} = \mathcal{F}(S)\text{-FPD}$.
- (2) $\mathcal{P}_C(R)\text{-FPD} = \mathcal{P}(S)\text{-FPD}$.
- (3) $\mathcal{J}_C(S)\text{-FID} = \mathcal{J}(R)\text{-FID}$.

Proof. (1) Suppose $\mathcal{F}_C(R)\text{-FPD} = n < \infty$. Let $N \in \text{Mod } S$ with $\text{fd}_S N < \infty$. Then $N \in \mathcal{A}_C(S)$ and $C \otimes_S N \in \mathcal{B}_C(R)$ by [11, Lemma 4.1 and Theorem 1]. It follows from [21, Lemma 2.6 (1)] that

$$\mathcal{F}_C(R)\text{-pd } C \otimes_S N = \text{fd}_S(C \otimes_S N)_* = \text{fd}_S N < \infty,$$

and hence $\text{fd}_S N = \mathcal{F}_C(R)\text{-pd } C \otimes_S N \leq n$. This yields $\mathcal{F}(S)\text{-FPD} \leq \mathcal{F}_C(R)\text{-FPD}$.

Conversely, suppose $\mathcal{F}(S)\text{-FPD} = n < \infty$. Let $M \in \text{Mod } R$ with $\mathcal{F}_C(R)\text{-pd } M < \infty$. Then we have $M \in \mathcal{B}_C(R)$ by [11, Corollary 6.1]. It follows from [21, Lemma 2.6 (1)] that

$$\text{fd}_S M_* = \mathcal{F}_C(R)\text{-pd } M < \infty,$$

and hence $\mathcal{F}_C(R)\text{-pd } M = \text{fd}_S M_* \leq n$. This yields $\mathcal{F}_C(R)\text{-FPD} \leq \mathcal{F}(S)\text{-FPD}$

Similarly, we get the assertions (2) and (3). \square

Recall that a ring R is called *left* (resp. *right*) \aleph_0 -Noetherian if any left (resp. right) ideal of R is countably generated. The class of left (resp. right) \aleph_0 -Noetherian rings includes countable rings and left (resp. right) Noetherian rings.

Proposition 4.2. *If S is a left \aleph_0 -Noetherian ring, then*

$$\mathcal{P}_C(R)\text{-FPD} \leq \mathcal{F}_C(R)\text{-FPD} + 1.$$

Proof. By [8, Proposition 2.8], we have $\mathcal{P}(S)\text{-FPD} \leq \mathcal{F}(S)\text{-FPD} + 1$. Now the assertion follows from (1)–(2) of Lemma 4.1. \square

We give a sufficient condition under which the finiteness of $\text{spcli } R$ and $\text{spcli } S^{\text{op}}$ is equivalent to the finiteness of $\text{sfcli } R$ and $\text{sfcli } S^{\text{op}}$.

Theorem 4.3. *If R is a right \aleph_0 -Noetherian ring and S is a left \aleph_0 -Noetherian ring, then the following statements are equivalent:*

- (1) $\text{spcli } R < \infty$ and $\text{spcli } S^{\text{op}} < \infty$.
- (2) $\text{sfcli } R < \infty$ and $\text{sfcli } S^{\text{op}} < \infty$.

If one of these two conditions is satisfied, then

$$|\text{spcli } R - \text{spcli } S^{\text{op}}| \leq 1.$$

Proof. (1) \Rightarrow (2) It is trivial.

(2) \Rightarrow (1) By (2) and Corollary 3.11, we have

$$\mathcal{F}_C(R)\text{-FPD} = \mathcal{F}_C(S^{\text{op}})\text{-FPD} = \text{sfcli } R = \text{sfcli } S^{\text{op}} < \infty.$$

Then $\mathcal{P}_C(R)\text{-FPD} \leq \mathcal{F}_C(R)\text{-FPD} + 1 < \infty$ by Proposition 4.2, and hence $\text{spcli } R < \infty$ by Proposition 3.2. Symmetrically, we get $\text{spcli } S^{\text{op}} < \infty$.

If one of the conditions (1) and (2) is satisfied, then $\text{spcli } R \leq \mathcal{P}_C(R)\text{-FPD}$ and $\text{spcli } S^{\text{op}} \leq \mathcal{P}_C(S^{\text{op}})\text{-FPD}$. Moreover, we may suppose

$$\mathcal{F}_C(R)\text{-FPD} = \mathcal{F}_C(S^{\text{op}})\text{-FPD} = \text{sfcli } R = \text{sfcli } S^{\text{op}} = n < \infty.$$

Then, by Proposition 4.2, we have

$$\begin{aligned} n &= \text{sfcli } R \leq \text{spcli } R \leq \mathcal{P}_C(R)\text{-FPD} \leq \mathcal{F}_C(R)\text{-FPD} + 1 = n + 1, \\ n &= \text{sfcli } S^{\text{op}} \leq \text{spcli } S^{\text{op}} \leq \mathcal{P}_C(S^{\text{op}})\text{-FPD} \leq \mathcal{F}_C(S^{\text{op}})\text{-FPD} + 1 = n + 1. \end{aligned}$$

The proof is finished. \square

Let $M \in \text{Mod } R$, and let $D \in \text{Mod } S^{\text{op}}$ be injective and ${}_R N_S$ a bimodule. Then we have an additive map

$$\Phi_M : \text{Hom}_{S^{\text{op}}}(N, D) \otimes_R M \rightarrow \text{Hom}_{S^{\text{op}}}(\text{Hom}_R(M, N), D)$$

defined by $\Phi_M(f \otimes m)(g) = f(g(m))$ for any $m \in M$, $f \in \text{Hom}_{S^{\text{op}}}(N, D)$ and $g \in \text{Hom}_R(M, N)$. Considering a projective resolution of M and applying homology, we obtain an additive map

$$\Phi_M^{(n)} : \text{Tor}_n^R(\text{Hom}_{S^{\text{op}}}(N, D), M) \rightarrow \text{Hom}_{S^{\text{op}}}(\text{Ext}_R^n(M, N), D)$$

for any $n \geq 0$, which does not depend on the choice of the projective resolution of M .

Lemma 4.4. *Let $M \in \text{Mod } R$ and let K be an n -syzygy of M with $n \geq 0$. Then, for any injective right S -module I , the additive map*

$$\Phi_M^{(n)} : \text{Tor}_n^R(I_*, M) \rightarrow \text{Hom}_{S^{\text{op}}}(\text{Ext}_R^n(M, C), I)$$

is monic if and only if the additive map

$$\Phi_K : I_* \otimes_R K \rightarrow \text{Hom}_{S^{\text{op}}}(\text{Hom}_R(K, C), I)$$

is monic.

Proof. The case for $S^{\text{op}} = \mathbb{Z}$ (the ring of integers) was proved in [8, Proposition 1.5]. The argument there is also valid in our setting. \square

We also need the following lemma.

Lemma 4.5. *For an integer $n \geq 0$, if $\text{Tor}_{n+1}^R(I_*, M) = 0$ for any finitely presented left R -module M and any injective right S -module I , then $\text{sfcli } S^{\text{op}} \leq n$.*

Proof. Let $M \in \text{Mod } R$. Then there exists a direct system $\{M_i\}_i$ consisting of finitely presented left R -modules such that $M = \varinjlim M_i$. It follows from [18, Proposition 7.8] and assumption that

$$\text{Tor}_{n+1}^R(I_*, M) \cong \text{Tor}_{n+1}^R(I_*, \varinjlim M_i) \cong \varinjlim \text{Tor}_{n+1}^R(I_*, M_i) = 0$$

for any injective right S -module I . Thus, by [21, Lemma 2.6 (1)], we have $\mathcal{F}_C(S^{\text{op}})\text{-pd } I = \text{fd}_{R^{\text{op}}} I_* \leq n$ and $\text{sfcli } S^{\text{op}} \leq n$. \square

For a countable inverse system $\{H_n, \lambda_n\}_{n \in \mathbb{N}}$, recall that \varprojlim^1 , the first derived functor of the inverse limit \varprojlim , is defined by the exact sequence

$$0 \longrightarrow \varprojlim H_n \longrightarrow \prod_{n \in \mathbb{N}} H_n \xrightarrow{\Delta} \prod_{n \in \mathbb{N}} H_n \longrightarrow \varprojlim^1 H_n \longrightarrow 0,$$

where $\Delta(x_n)_{n \in \mathbb{N}} = (x_n - \lambda_n(x_{n+1}))_{n \in \mathbb{N}}$ for any $(x_n)_{n \in \mathbb{N}} \in \prod_{n \in \mathbb{N}} H_n$ (see [25, Section 3.5]).

Let R be a left \aleph_0 -Noetherian ring, and let $M \in \text{Mod } R$ be cyclic and let

$$\cdots \rightarrow F_i \rightarrow \cdots \rightarrow F_1 \rightarrow F_0 \rightarrow M \rightarrow 0$$

be a free resolution of M in $\text{Mod } R$ with all F_i countably generated and set $K := \text{Im}(F_n \rightarrow F_{n-1})$. Then K is countably presented by [15, Lemma 1], and hence there exists a countable direct system $\{K_i\}_i$ of finitely presented submodules of K such that $K = \varinjlim K_i$. It is known that there exists a short exact sequence of Ext-groups

$$0 \rightarrow \varprojlim^1 \text{Ext}_R^{j-1}(K_i, -) \rightarrow \text{Ext}_R^j(K, -) \rightarrow \varprojlim \text{Ext}_R^j(K_i, -) \rightarrow 0 \quad (4.1)$$

for any $j \geq 1$ (see [25, Application 3.5.10]). In particular, for any set J , we have the following exact sequence:

$$0 \rightarrow \varprojlim^1 \text{Hom}_R(K_i, C^{(J)}) \rightarrow \text{Ext}_R^1(K, C^{(J)}) \rightarrow \varprojlim \text{Ext}_R^1(K_i, C^{(J)}) \rightarrow 0. \quad (4.2)$$

Since K_i is finitely presented, we have $\text{Ext}_R^1(K_i, C^{(J)}) \cong \text{Ext}_R^1(K_i, C)^{(J)}$ and the inverse system $\{\text{Ext}_R^1(K_i, C^{(J)})\}_i$ is naturally identified with the direct sum $(\{\text{Ext}_R^1(K_i, C)\}_i)^{(J)}$ of copies of the inverse system $\{\text{Ext}_R^1(K_i, C)\}_i$. Then

$$\varprojlim \text{Ext}_R^1(K_i, C^{(J)}) \cong \varprojlim (\text{Ext}_R^1(K_i, C))^{(J)} \subseteq \varprojlim (\text{Ext}_R^1(K_i, C))^J \cong (\varprojlim \text{Ext}_R^1(K_i, C))^J.$$

Suppose $\text{id}_R C \leq n$ and $\varprojlim^1 \text{Hom}_R(K_i, C^{(J)}) = 0$. Then $\text{Ext}_R^1(K, C) \cong \text{Ext}_R^{n+1}(M, C) = 0$, and hence the exact sequence

$$0 \rightarrow \varprojlim^1 \text{Hom}_R(K_i, C) \rightarrow \text{Ext}_R^1(K, C) \rightarrow \varprojlim \text{Ext}_R^1(K_i, C) \rightarrow 0$$

implies $\varprojlim \text{Ext}_R^1(K_i, C) = 0$ and $(\varprojlim (\text{Ext}_R^1(K_i, C)))^J = 0$. Thus $\varprojlim \text{Ext}_R^1(K_i, C^{(J)}) = 0$, and therefore,

$$\text{Ext}_R^{n+1}(M, C^{(J)}) \cong \text{Ext}_R^1(K, C^{(J)}) = 0$$

by dimension shifting and the exact sequence (4.2).

We are now in a position to prove the following result.

Theorem 4.6. *The following inequality holds:*

$$\text{id}_R C^{(\mathbb{N})} \leq \text{siclp } S.$$

Furthermore, if R is a left \aleph_0 -Noetherian ring, then

$$\text{sfcli } S^{\text{op}} \leq \text{id}_R C^{(\mathbb{N})} = \text{siclp } S.$$

Proof. By [11, Lemma 4.1 and Proposition 4.2 (a)], we have that S and $S^{(\mathbb{N})}$ are in $\mathcal{A}_C(S)$. It follows from [21, Lemma 2.6 (c)] that

$$\text{id}_R C^{(\mathbb{N})} = \text{id}_R(C \otimes_S S^{(\mathbb{N})}) = \mathcal{I}_C(S)\text{-id } S^{(\mathbb{N})} \leq \text{siclp } S.$$

Suppose that R is a left \aleph_0 -Noetherian ring and $\text{id}_R C^{(\mathbb{N})} = n < \infty$. Let $M \in \text{Mod } R$ be cyclic and keep the notations as above. Since K_i is finitely presented, we have that $\text{Hom}_R(K_i, C^{(J)}) \cong \text{Hom}_R(K_i, C)^{(J)}$ and the inverse system $\{\text{Hom}_R(K_i, C^{(J)})\}_i$ is naturally identified with the direct sum $\{\text{Hom}_R(K_i, C)^{(J)}\}_i$ of copies of the inverse system $\{\text{Hom}_R(K_i, C)\}_i$. Since $\text{Ext}_R^1(K_i, C^{(\mathbb{N})}) \cong \text{Ext}_R^{n+1}(M, C^{(\mathbb{N})}) = 0$, it follows from [7, Proposition 2.3] that the additive map

$$\Phi_K : \text{Hom}_{\mathbb{Z}}(C, D) \otimes_R K \rightarrow \text{Hom}_{\mathbb{Z}}(\text{Hom}_R(K, C), D)$$

is monic for any divisible abelian group D , and hence the induced additive map

$$\text{Hom}_{\mathbb{Z}}(C^{(J)}, D) \otimes_R K \rightarrow \text{Hom}_{\mathbb{Z}}(\text{Hom}_R(K, C^{(J)}), D)$$

is also monic by [1, Lemma 1.1 and Proposition 1.2] and [8, Theorem 1.3]. It follows from [6, Corollary 6] and [8, Theorem 1.3] that $\varprojlim^1 \text{Hom}_R(K_i, C^{(J)}) = 0$.

Since $\text{id}_R C \leq \text{id}_R C^{(\mathbb{N})} = n$, it follows from the argument before this theorem that $\text{Ext}_R^{n+1}(M, C^{(J)}) = 0$. Then, by [21, Lemma 2.6 (3)] and the Baer's criterion, we have

$$\mathcal{I}_C(S)\text{-id } S^{(J)} = \text{id}_R C \otimes S^{(J)} = \text{id}_R C^{(J)} \leq n.$$

So, $\mathcal{I}_C(S)\text{-id } P \leq n$ for any projective left S -module P , and hence $\text{siclp } S \leq n$.

It remains to prove $\text{sfcli } S^{\text{op}} \leq n$. Let $M' \in \text{Mod } R$ be countably generated (in particular, M' can be finitely presented) and let

$$\cdots \rightarrow F_i \rightarrow \cdots \rightarrow F_1 \rightarrow F_0 \rightarrow M' \rightarrow 0$$

be a free resolution of M' in $\text{Mod } R$ with all F_i countably generated and set $K' := \text{Im}(F_{n+1} \rightarrow F_n)$. Then we have $\text{Ext}_R^1(K', C^{(\mathbb{N})}) \cong \text{Ext}_R^{n+2}(M', C^{(\mathbb{N})}) = 0$. Since K' is countably presented, there exists a countable direct system of finitely presented submodules of K' such that K' is the direct limit of this direct system. It follows from [1, Lemma 1.1 and Example 2.4 (4)] and [2, Theorem 8.10] that the additive map

$$\Phi_{K'} : I_* \otimes_R K' \longrightarrow \text{Hom}_{S^{\text{op}}}(\text{Hom}_R(K', C), I)$$

is monic for any injective right S -module I . Then, by Lemma 4.4, the additive map

$$\Phi_M^{(n+1)} : \text{Tor}_{n+1}^R(I_*, M') \longrightarrow \text{Hom}_{S^{\text{op}}}(\text{Ext}_R^{n+1}(M', C), I)$$

is also monic. Since $\text{id}_R C \leq \text{id}_R C^{(\mathbb{N})} = n$, we have $\text{Ext}_R^{n+1}(M', C) = 0$, and hence $\text{Tor}_{n+1}^R(I_*, M') = 0$. It follows from Lemma 4.5 that $\text{sfcli } S^{\text{op}} \leq n$. \square

Proposition 4.7. *Let R be a left \aleph_0 -Noetherian ring. Then the following assertions hold:*

- (1) *For any $n \geq 1$, if $\text{id}_R C \leq n$ and $\text{sfcli } S^{\text{op}} \leq n - 1$, then $\text{siclp } S \leq n$.*
- (2) *If $\text{id}_R C < \text{siclp } S$, then $\text{siclp } S = \text{sfcli } S^{\text{op}} + 1$.*

Proof. (1) Since $\text{sfcli } S^{\text{op}} \leq n - 1$, it follows from [21, Lemma 2.6 (1)] that $\text{fd}_{R^{\text{op}}} I_* = \mathcal{F}_C(S^{\text{op}})\text{-pd } I \leq n - 1$ for any injective right S -module I , and hence $\text{Tor}_n^R(I_*, M) = 0$ for any $M \in \text{Mod } R$.

Let M be a cyclic left R -module and keep the notations as before Theorem 4.6. Then, by (4.1), we have the following exact sequence:

$$0 \rightarrow \varprojlim^1 \text{Hom}_R(K_i, C^{(\mathbb{N})}) \rightarrow \text{Ext}_R^1(K, C^{(\mathbb{N})}) \rightarrow \varprojlim \text{Ext}_R^1(K_i, C^{(\mathbb{N})}) \rightarrow 0.$$

Notice that the additive map

$$\Phi_M^{(n)} : \text{Tor}_n^R(I_*, M) \rightarrow \text{Hom}_{S^{\text{op}}}(\text{Ext}_R^n(M, C), I)$$

is monic, it follows from Lemma 4.4 that the additive map

$$\Phi_K : I_* \otimes_R K \rightarrow \text{Hom}_{S^{\text{op}}}(\text{Hom}_R(K, C), I)$$

is monic, and hence the induced additive map

$$\text{Hom}_{S^{\text{op}}}(C^{(\mathbb{N})}, I) \otimes_R K \rightarrow \text{Hom}_{S^{\text{op}}}(\text{Hom}_R(K, C^{(\mathbb{N})}), I)$$

is also monic by [1, Lemma 1.1 and Proposition 1.2] and [2, Theorem 8.10]. Thus $\varprojlim^1 \text{Hom}_R(K_i, C^{(\mathbb{N})}) = 0$ by [6, Corollary 6] and [2, Theorem 8.10].

Since $\text{id}_R C \leq n$, it follows from the argument before Theorem 4.6 that $\text{Ext}_R^{n+1}(M, C^{(\mathbb{N})}) = 0$. Then, by Theorem 4.6 and the Baer's criterion, we have

$$\text{siclp } S = \text{id}_R C^{(\mathbb{N})} \leq n.$$

(2) The assumption $\text{id}_R C < \text{siclp } S$ implies $\text{id}_R C < \infty$. If $\text{siclp } S$ is infinite, then $\text{sfcli } S^{\text{op}}$ is also infinite and the assertion follows.

Now suppose $\text{siclp } S = n < \infty$. Then $\text{id}_R C \leq n - 1$ and $\text{Ext}_R^n(M, C) = 0$ for any $M \in \text{Mod } R$. By Theorem 4.6, we have $\text{sfcli } S^{\text{op}} \leq \text{siclp } S = n$. If $\text{sfcli } S^{\text{op}} \leq n - 2$, then $\text{siclp } S \leq n - 1$ by (1), which is a contradiction. Thus $\text{sfcli } S^{\text{op}} \geq n - 1$.

Now it suffices to prove $\text{sfcli } S^{\text{op}} \leq n - 1$. Let $M \in \text{Mod } R$ be countably generated (in particular, finitely presented) and let

$$\cdots \rightarrow F_i \rightarrow \cdots \rightarrow F_1 \rightarrow F_0 \rightarrow M \rightarrow 0$$

be a free resolution of M in $\text{Mod } R$ with all F_i countably generated and set $K := \text{Im}(F_n \rightarrow F_{n-1})$. By Theorem 4.6, we have $\text{id}_R C^{(\mathbb{N})} = \text{siclp } S = n$, so

$$\text{Ext}_R^1(K, C^{(\mathbb{N})}) \cong \text{Ext}_R^{n+1}(M, C^{(\mathbb{N})}) = 0.$$

It follows from [1, Lemma 1.1 and Example 2.4 (4)] and [2, Theorem 8.10] that the additive map

$$\Phi_K : I_* \otimes_R K \rightarrow \text{Hom}_{S^{\text{op}}}(\text{Hom}_R(K, C), I)$$

is monic for any injective right S -module I . Then, by Lemma 4.4, the additive map

$$\Phi_M^{(n)} : \text{Tor}_n^R(I_*, M) \rightarrow \text{Hom}_{S^{\text{op}}}(\text{Ext}_R^n(M, C), I)$$

is also monic. Since $\text{id}_R C \leq n - 1$, we have $\text{Ext}_R^n(M, C) = 0$, and so $\text{Tor}_n^R(I_*, M) = 0$. It follows from Lemma 4.5 that $\text{sfcli } S^{\text{op}} \leq n - 1$. \square

Corollary 4.8. *Let R be a left \aleph_0 -Noetherian ring. Then the following statements are equivalent:*

- (1) $\text{siclp } S < \infty$.
- (2) $\text{sfcli } S^{\text{op}} < \infty$ and $\text{id}_R C < \infty$.

Proof. It follows from Theorem 4.6 and Proposition 4.7 (2). \square

We write

$$\begin{aligned} \text{Fflic } S &:= \sup\{\text{fd}_S E \mid \text{fd}_S E < \infty \text{ with } E \in \mathcal{I}_C(S)\}, \\ \text{Fplic } S &:= \sup\{\text{pd}_S E \mid \text{pd}_S E < \infty \text{ with } E \in \mathcal{I}_C(S)\}. \end{aligned}$$

The following result extends [14, Proposition 1].

Theorem 4.9. *Let R be a left Noetherian ring. Then*

$$\text{sflic } R^{\text{op}} = \text{sfcli } S^{\text{op}} = \text{id}_R C = \text{siclp } S \geq \max\{\text{Fflic } S, \text{Fplic } S\}.$$

Proof. Since R is a left Noetherian ring, $\text{id}_R C^{(\mathbb{N})} = \text{id}_R C$ by [4, Theorem 1.1]. Then, by [12, Lemma 17.2.4 (2)] and Theorem 4.6, we have

$$\text{sflic } R^{\text{op}} = \text{id}_R C = \text{siclp } S.$$

Since $\text{fd}_{R^{\text{op}}} I_* = \mathcal{F}_C(S^{\text{op}})\text{-pd } I$ for any injective right S -module I by [21, Lemma 2.6 (1)], we have

$$\text{sflic } R^{\text{op}} = \text{sfcli } S^{\text{op}}.$$

Suppose that $\text{id}_R C = n < \infty$ and $E \in \text{Mod } S$ is C -injective with $\text{fd}_S E = m < \infty$. Then $E = I'_*$ for some injective left R -module I' and there exists an exact sequence

$$0 \rightarrow F_m \rightarrow S^{(J_{m-1})} \rightarrow \dots \rightarrow S^{(J_1)} \rightarrow S^{(J_0)} \rightarrow E(= I'_*) \rightarrow 0 \quad (4.3)$$

in $\text{Mod } S$ with F_m flat and J_i an index set for any $0 \leq i \leq m - 1$. By [11, Corollary 6.1], we have $I' \in \mathcal{B}_C(R)$ and $E \in \mathcal{A}_C(S)$, so applying the functor $C \otimes_S -$ to the exact sequence (4.3) yields the following exact sequence:

$$0 \rightarrow K_m \xrightarrow{d_m} C^{(J_{m-1})} \rightarrow \dots \rightarrow C^{(J_1)} \rightarrow C^{(J_0)} \rightarrow C \otimes_S I'_* (\cong I') \rightarrow 0 \quad (4.4)$$

in $\text{Mod } R$ with $K_m = C \otimes_S F_m (\in \mathcal{F}_C(R))$. By [21, Lemma 2.5 (1)], we have $\text{Ext}_R^{\geq 1}(C^{(J_i)}, K_m) = 0$ for any $0 \leq i \leq m - 1$.

Since R is a left Noetherian ring and $\text{id}_R C = n$, it follows from [4, Theorem 1.1] that $\text{id}_R K_m \leq n$. If $m > n$, then $\text{Ext}_R^m(I', K_m) = 0$. It follows from the exact sequence (4.4) that $\text{Ext}_R^1(\text{Coker } d_m, K_m) = 0$. Thus the exact sequence

$$0 \rightarrow K_m \xrightarrow{d_m} C^{(J_{m-1})} \rightarrow \text{Coker } d_m \rightarrow 0$$

splits and $\text{Coker } d_m$ is a direct summand of $C^{(J_{m-1})}$. By [11, Proposition 5.1 (b)], we have $\text{Coker } d_m \in \mathcal{P}_C(R)$, and hence $\mathcal{P}_C(R)\text{-pd } I' \leq m - 1$. Then applying [21, Lemma 2.6 (2)] yields

$$\text{fd}_S E \leq \text{pd}_S E = \mathcal{P}_C(R)\text{-pd } I' \leq m - 1,$$

which is a contradiction. Thus we conclude that $m \leq n$ and

$$\text{id}_R C \geq \text{Fflic } S.$$

Similarly, we have

$$\text{id}_R C \geq \text{Fplic } S. \quad \square$$

Finally, we turn to countable rings.

Theorem 4.10. *Let S be a countable ring and let $M \in \text{Mod } R$ be countable and $n \geq 0$. Then the following statements are equivalent:*

- (1) $\mathcal{P}_C(R)\text{-pd } M \leq n$.
- (2) $\mathcal{P}_C(R)\text{-pd } M \leq n + 1$ and $\text{Ext}_R^{n+1}(M, C) = 0$.

Proof. By [21, Lemma 2.5 (1)], it is easy to get (1) \Rightarrow (2).

(2) \Rightarrow (1) Since $\mathcal{P}_C(R)\text{-pd } M$ is finite by (2), we have $M \in \mathcal{B}_C(R)$ by [11, Corollary 6.1]. Since ${}_R C$ is finitely generated, there exists a positive integer t such that

$$R^t \rightarrow C \rightarrow 0$$

is exact in $\text{Mod } R$, and hence

$$0 \rightarrow M_* \rightarrow \text{Hom}_R(R^t, M) (\cong M^t)$$

is exact. Since M is countable left R -module, we have that M^t is a countable left R -module. So, the set M_* is countable, and hence M_* is a countable left S -module. It follows that

$$\begin{aligned} \mathcal{P}_C(R)\text{-pd } M \leq n + 1 \text{ and } \text{Ext}_R^{n+1}(M, C) = 0 & \quad (\text{by (2)}) \\ \iff \text{pd}_S M_* \leq n + 1 \text{ and } \text{Ext}_S^{n+1}(M_*, S) = 0 & \quad (\text{by (3.1) and (3.3)}) \\ \iff \text{pd}_S M_* \leq n & \quad (\text{by [8, Corollary 2.23]}) \\ \iff \mathcal{P}_C(R)\text{-pd } M \leq n & \quad (\text{by (3.1)}). \end{aligned}$$

□

Putting $n = 0$ in Theorem 4.10, we get the following result.

Corollary 4.11. *Let S be a countable ring and let $M \in \text{Mod } R$ be countable. Then the following statements are equivalent:*

- (1) M is C -projective.
- (2) $\mathcal{P}_C(R)\text{-pd } M \leq 1$ and $\text{Ext}_R^1(M, C) = 0$.

Corollary 4.12. *Let S be a countable ring and let $0 \neq M \in \text{Mod } R$ be countable with $\mathcal{P}_C(R)\text{-pd } M = n < \infty$. Then $\text{Ext}_R^n(M, C) \neq 0$ and hence $\text{id}_R C \geq n$.*

Proof. If $\text{Ext}_R^n(M, C) = 0$, then $\mathcal{P}_C(R)\text{-pd } M \leq n - 1$ by assumption and Theorem 4.10, which is a contradiction. □
